

Neetechs.com documentation

Neetechs.com is a website that will allow tech geeks to **post** their idea and experience. It also allows them to boost their skill by learning from other geeks in the home section or by learning from the **learning section**. Neetechs.com also allows people to post their services which also allows other people to hire their skills.

To Create this website:

1. First, I will create the **login** and registration system.
2. Second, I will create the **profile** page.
3. **Settings** Page
4. The home page will contain the creation **post** and the list.
5. The left sidebar will contain some fast links to the **important page** of the website.
6. The right sidebar will contain some ads or maybe some future updates.
7. The navbar will have a **search bar** and the logo, home, **services**, **products**, profile, **messages**, notification buttons. Login and a logout button.
8. The **notification** system (I am not sure if I have time to complete it)
9. The chatting System
10. Finally, I will create a dashboard for organizing the **services**, **products**, and **Posts**

The Programing languages and the other techniques that will be used are:

- Pure HTML (HTML, CSS, Bootstrap, JQuery)
- MVC in the backend
- WebApi and React for the dashboard if I have the time to create it.

The class that I will add to create the website:

- Users
- Products: Users
- Services: Users
- Profile: Users
- Settings: Users
- Posts: Users
- Messages: Users
- Notification: Users
